NETD - Lab 5 Explanation

The purpose of this app is for event managers and organizers to help keep track of how many organizers are available as well as what events they manage. Every few months a couple of my friends and I try to run a small Super Smash Bros. tournament, and we usually have multiple types of events (such as singles and doubles) and we've been thinking about including different games as well when it's safe to host larger events. We'll also often have tournament organizers come that host their own tourneys, and they'll typically be willing to help run things. I made this app with these events in mind, trying to make it something that we may use at some point to help keep track of what organizers we have available and what events we're trying to run. I chose to create this application to impress a potential employer because it's a perfect example of a CRUD application that makes use of the entity framework. It's easily scalable and easy to change to whatever suits the employer's needs, but for the purpose of showing what I'm able to create it's fine as is. It also makes use of the popular front-end framework "Foundation", which is an alternative to bootstrap. It helped create some simple but stylish nav-bars and tables that look more user friendly when compared to the default bootstrap styling used by the entity framework.
